Wireless AC Dual-Band ADSL Router

Ethernet Cable

Power Adapter

WI-FI Configuration Note

If any of the above items are missing, please contact your reseller.

Note: Using a power supply with a different voltage rating than the one included with the Wireless AC Dual-Band ADSL Router will cause damage and void the warranty for this product.

System Requirements

Network Requirements	<ul style="list-style-type: none">• An Ethernet-based Cable or DSL modem• IEEE 802.11ac, 802.11a, 802.11n or 802.11g wireless clients• 10/100 Ethernet
Web-based Configuration Utility Requirements	<p>Computer with the following:</p> <ul style="list-style-type: none">• Windows®, Macintosh, or Linux-based operating system• An installed Ethernet adapter <p>Browser Requirements: Microsoft Internet Explorer® v7, Mozilla® Firefox® v9.0, Google® Chrome 16.0, or Safari® v4 or higher version</p> <p>Windows® Users: Make sure you have the latest version of Java installed. Visit www.java.com to download the latest version.</p>

Introduction

The D-Link Wireless AC Dual-Band ADSL Router is a IEEE 802.11ac compliant device that delivers up to 3 times faster speeds than 802.11n while staying backward compatible with 802.11a/g/b devices. Connect the Wireless AC Dual-Band ADSL Router to a Cable or DSL modem and provide high-speed Internet access to multiple computers, game consoles, and media players. Create a secure wireless network to share photos, files, music, videos, printers, and network storage. Powered by the 802.11ac technology this router provides wireless coverage for homes and offices, or for users running bandwidth-intensive applications.

With some routers, all wired and wireless traffic, including VoIP, Video Streaming, Online Gaming, and Web browsing are mixed together into a single data stream. By handling data this way, applications like video streaming could pause or delay. With the D-Link Intelligent QoS Technology, wired and wireless traffic are analyzed and separated into multiple data streams.

The Wireless AC Dual-Band ADSL Router supports the latest wireless security features to help prevent unauthorized access, be it from over a wireless network or the Internet. Support for WPA™ and WPA2™ standards ensure that you will be able to use the best possible encryption regardless of your client devices. In addition, this router utilizes Dual Active Firewalls (SPI and NAT) to prevent potential attacks from across the Internet for the ideal centerpiece for your wireless network in the home or office.

Features

- **Ultimate Fast Wireless Networking** - The Wireless AC Dual-Band ADSL Router provides up to 300Mbps wireless connection in 2.4GHz band, 433Mbps wireless connection in 5GHz with other 802.11ac and draft 802.11n wireless clients. This capability allows users to participate in real-time activities online, such as video streaming, online gaming, and real-time audio. The performance of this 802.11ac wireless router gives you the freedom of wireless networking at speeds 3x faster than 802.11n.
- **Compatible with 802.11a/g/n Devices** - The Wireless AC Dual-Band ADSL Router is still fully compatible with the IEEE 802.11a, 802.11g and 802.11n, so it can connect with existing 802.11a, 802.11g and 802.11n PCI, USB, and Cardbus adapters.
- **Advanced Firewall Features** - The Web-based user interface displays a number of advanced network management features including:
 - **Content Filtering** - Easily applied content filtering based on MAC Address, URL, and/or Domain Name.
 - **Filter Scheduling** - These filters can be scheduled to be active on certain days or for a duration of hours or minutes.
 - **Secure Multiple/Concurrent Sessions** - The Wireless AC Dual-Band ADSL Router can pass through VPN sessions. It supports multiple and concurrent IPSec and PPTP sessions, so users behind the Wireless AC Dual-Band ADSL Router can securely access corporate networks.
- **User-friendly Setup Wizard** - Through its easy-to-use Web-based user interface, the Wireless AC Dual-Band ADSL Router lets you control what information is accessible to those on the wireless network, whether from the Internet or from your company's server. Configure your router to your specific settings within minutes.

* Maximum wireless signal rate derived from IEEE Standard 802.11a, 802.11g, 802.11n and draft 802.11ac specifications. Actual data throughput will vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate. Environmental conditions will adversely affect wireless signal range.

Hardware Overview

LEDs

1	Power LED	A solid green light indicates a proper connection to the power supply.
2	DSL LED	A solid green light indicates a proper DSL connection.
3	Internet LED	A solid light indicates connection on the Internet port.
4	Local Network LEDs	A solid light indicates a connection to an Ethernet-enabled computer on ports 1-4. This LED blinks during data transmission
5	Wireless LED	A solid light indicates that the wireless networks are ready.
6	WPS LED	This LED blinks during WPS handshake phase.
7	USB LED	A solid green light indicates a USB is connected.

Hardware Overview

Back

1	Internet/DSL Port	Using an Ethernet cable, connect your broadband modem to this port.
2	LAN Ports (1-4)	Connect 10/100 Ethernet devices such as computers, switches, storage (NAS) devices and game consoles.
3	Reset Button	Insert a paperclip in the hole and wait for several seconds to reset the router to default settings.
4	USB Port	Attaches to a USB 2.0 printer or storage device to share with your network.
5	Power Receptor	Receptor for the supplied power adapter.

Hardware Overview

Left

1	2.4 GHz Wireless	Use this button to initiate a WPS connection on the 2.4 GHz band.
2	5 GHz Wireless	Use this button to initiate a WPS connection on the 5 GHz band.
3	Power	Use this button to power the device on or off.

Installation

This section will walk you through the installation process. Placement of the router is very important. Do not place the router in an enclosed area such as a closet, cabinet, or in the attic or garage.

Before you Begin

- Please configure the router with the computer that was last connected directly to your modem.
- You can only use the Ethernet port on your modem. If you were using the USB connection before using the router, then you must turn off your modem, disconnect the USB cable and connect an Ethernet cable to the Internet port on the router, and then turn the modem back on. In some cases, you may need to call your ISP to change connection types (USB to Ethernet).
- If you have DSL and are connecting via PPPoE, make sure you disable or uninstall any PPPoE software such as WinPoet, Broadjump, or Enternet 300 from your computer or you will not be able to connect to the Internet.

Wireless Basics

D-Link wireless products are based on industry standards to provide easy-to-use and compatible high-speed wireless connectivity within your home, business or public access wireless networks. Strictly adhering to the IEEE standard, the D-Link wireless family of products will allow you to securely access the data you want, when and where you want it. You will be able to enjoy the freedom that wireless networking delivers.

A wireless local area network (WLAN) is a cellular computer network that transmits and receives data with radio signals instead of wires. Wireless LANs are used increasingly in both home and office environments, and public areas such as airports, coffee shops and universities. Innovative ways to utilize WLAN technology are helping people to work and communicate more efficiently. Increased mobility and the absence of cabling and other fixed infrastructure have proven to be beneficial for many users.

Wireless users can use the same applications they use on a wired network. Wireless adapter cards used on laptop and desktop systems support the same protocols as Ethernet adapter cards.

Under many circumstances, it may be desirable for mobile network devices to link to a conventional Ethernet LAN in order to use servers, printers or an Internet connection supplied through the wired LAN. A Wireless Router is a device used to provide this link.

Wireless Installation Considerations

The D-Link wireless router lets you access your network using a wireless connection from virtually anywhere within the operating range of your wireless network. Keep in mind, however, that the number, thickness and location of walls, ceilings, or other objects that the wireless signals must pass through, may limit the range. Typical ranges vary depending on the types of materials and background RF (radio frequency) noise in your home or business. The key to maximizing wireless range is to follow these basic guidelines:

1. Keep the number of walls and ceilings between the D-Link router and other network devices to a minimum - each wall or ceiling can reduce your adapter's range from 3-90 feet (1-30 meters.) Position your devices so that the number of walls or ceilings is minimized.
2. Be aware of the direct line between network devices. A wall that is 1.5 feet thick (.5 meters), at a 45-degree angle appears to be almost 3 feet (1 meter) thick. At a 2-degree angle it looks over 42 feet (14 meters) thick! Position devices so that the signal will travel straight through a wall or ceiling (instead of at an angle) for better reception.
3. Building Materials make a difference. A solid metal door or aluminum studs may have a negative effect on range. Try to position access points, wireless routers, and computers so that the signal passes through drywall or open doorways. Materials and objects such as glass, steel, metal, walls with insulation, water (fish tanks), mirrors, file cabinets, brick, and concrete will degrade your wireless signal.
4. Keep your product away (at least 3-6 feet or 1-2 meters) from electrical devices or appliances that generate RF noise.
5. If you are using 2.4GHz cordless phones or X-10 (wireless products such as ceiling fans, lights, and home security systems), your wireless connection may degrade dramatically or drop completely. Make sure your 2.4GHz phone base is as far away from your wireless devices as possible. The base transmits a signal even if the phone is not in use.

Installation

1. Turn off and unplug your cable or DSL broadband modem. This is required.

2. Position your router close to your modem and a computer. Place the router in an open area of your intended work area for better wireless coverage.
3. Unplug the Ethernet cable from your modem (or existing router if upgrading) that is connected to your computer. Plug it into the LAN port labeled **1** on the back of your router. The router is now connected to your computer.

Connect a Wireless Client to your Router

WPS Button

The easiest and most secure way to connect your wireless devices to the router is WPS (Wi-Fi Protected Setup). Most wireless devices such as wireless adapters, media players, Blu-ray DVD players, wireless printers and cameras will have a WPS button (or a software utility with WPS) that you can press to connect to the GO-DSL-AC750 router. Please refer to your user manual for the wireless device you want to connect to make sure you understand how to enable WPS. Once you know, follow the steps below:

Step 1 - Press the WPS button on the side of GO-DSL-AC750 for about 1 second. The Internet LED on the front will start to blink.

Step 2 - Within 2 minutes, press the WPS button on your wireless client (or launch the software utility and start the WPS process).

Step 3 - Allow up to 1 minute to configure. Once the Internet light stops blinking, you will be connected and your wireless connection will be secure with WPA2.

Configuration

Web-based Configuration Utility

This section will show you how to configure your D-Link wireless access point using the web-based configuration utility.

If you wish to change the default settings or adjust the configuration of the GO-DSL-AC750 you may use the web-based configuration utility.

To access the configuration utility, open a web browser such as Internet Explorer and enter **http://192.168.1.1** in the address field.

Select **admin** from the drop-down menu and then enter your password. The default password is **admin**. You will be directed to the **Setup Wizard** page.

A screenshot of a web-based login interface. At the top is an orange header with the word 'LOGIN' in white. Below the header, the text 'Input username and password' is displayed. There are two input fields: 'Username:' with a dropdown menu showing 'admin', and 'Password:' with a masked field of six dots. Below these fields is a checkbox labeled 'Remember my login info. on this computer'. At the bottom right is a blue 'login' button.

This wizard is designed to guide you through a step-by-step process to configure your new D-Link router and connect to the Internet.

Click the **Setup Wizard** button to continue.

Setup Wizard

Click **Setup Wizard** to configure your router.

If you want to configure the access point manually without running the wizard, skip to “Manual Configuration” on page 20.

Click **Next** to continue.

This section of the wizard enables you to use an international time server to set the internal time and date for the router.

Automatically Synchronize: Enable or disable automatic synchronisation with an Internet Time Server.

1st NTP Time Server: Specify an address for the primary Internet Time Server.

2nd NTP Time Server: Specify an address for the secondary Internet Time Server.

Time Zone: Select your time zone from the drop down menu.

Enable Daylight Saving: Enable or disable daylight saving.

Daylight Saving Start/End: Specify the time and date when daylight saving should start/end.

STEP 1: SET TIME AND DATE → 2 → 3 → 4

The Time Configuration option allows you to configure, update, and maintain the correct time on the internal system clock. From this section you can set the time zone that you are in and set the NTP (Network Time Protocol) Server. Daylight Saving can also be configured to automatically adjust the time when needed.

TIME SETTING

☒ **Automatically synchronize with Internet time servers**

1st NTP time server : europe.pool.ntp.org

2nd NTP time server : 192.168.2.100

TIME CONFIGURATION

Time Zone : (GMT+01:00) Amsterdam, Berlin, Rome, Stockholm, Vienna, Paris ▼

☒ **Enable Daylight Saving**

Daylight Saving Start : 2012 Year 03 Mon 11 Day 02 Hour 00 Min 00 Sec

Daylight Saving End : 2012 Year 11 Mon 04 Day 02 Hour 00 Min 00 Sec

This section of the wizard enables you to configure your internet connection type. Select the appropriate wan connection type which is provided by your ISP.

If the router detected or you selected **PPPoE**, enter your PPPoE username and password and click **Next** to continue.

Note: Make sure to remove your PPPoE software from your computer. The software is no longer needed and will not work through a router.

If the router detected or you selected **PPTP**, enter your PPTP username, password, and other information supplied by your ISP. Click **Next** to continue.

If the router detected or you selected **L2TP**, enter your L2TP username, password, and other information supplied by your ISP. Click **Next** to continue.

STEP 2: SETUP INTERNET CONNECTION — 3 — 4

WAN Mode:

DSL Mode:

Protocol:

802.1Q VLAN ID: (0 = disable, 1 - 4094)

Encapsulation Mode:

VPI: (0-255)

VCI: (32-65535)

Search Available PVC:

PPPOE/PPPOA

Please enter your Username and Password as provided by your ISP (Internet Service Provider). Please enter the information exactly as shown taking note of upper and lower cases. Click "Next" to continue.

Username:

Password:

Confirm Password:

This section of the wizard enables you to configure your 2.4G wireless connection. You can also configure the wireless network and security settings. If you prefer not to, uncheck the **Enable Your Wireless Network** box.

Choose a network name for your wireless network, and choose if you wish to make the wireless network **visible** or **invisible**.

It is highly recommended to secure your wireless network. Select from the available options. For more information see “Wireless Security” on page 117.

Click **Next** to continue.

STEP 3: CONFIGURE 2.4G WIRELESS NETWORK → 4

Your wireless network is enabled by default. You can simply uncheck it to disable it and click "Next" to skip configuration of wireless network.

Enable Your Wireless Network : ☒

Your wireless network needs a name so it can be easily recognized by wireless clients. For security purposes, it is highly recommended to change the pre-configured network name.

Wireless Network Name (SSID) : D-Link GO-DSL-AC750

Select "Visible" to publish your wireless network and SSID can be found by wireless clients, or select "Invisible" to hide your wireless network so that users need to manually enter SSID in order to connect to your wireless network.

Visibility Status : ☒ Visible ☐ Invisible

In order to protect your network from hackers and unauthorized users, it is highly recommended you choose one of the following wireless network security settings.

None	Security Level	Best	
<input checked="" type="radio"/> None	<input type="radio"/> WEP	<input type="radio"/> WPA-PSK	<input type="radio"/> WPA2-PSK

Security Mode:None
Select this option if you do not want to activate any security features.

This section of the wizard enables you to configure your 5G wireless connection. You can also configure the wireless network and security settings. If you prefer not to, uncheck the **Enable Your Wireless Network** box.

Choose a network name for your wireless network, and choose if you wish to make the wireless network **visible** or **invisible**.

It is highly recommended to secure your wireless network. Select from the available options. For more information see “Wireless Security” on page 117.

Click **Next** to continue.

STEP 3: CONFIGURE 5G WIRELESS NETWORK → 4

Your wireless network is enabled by default. You can simply uncheck it to disable it and click "Next" to skip configuration of wireless network.

Enable Your Wireless Network : ☒

Your wireless network needs a name so it can be easily recognized by wireless clients. For security purposes, it is highly recommended to change the pre-configured network name.

Wireless Network Name (SSID) : D-Link GO-DSL-AC750_!

Select "Visible" to publish your wireless network and SSID can be found by wireless clients, or select "Invisible" to hide your wireless network so that users need to manually enter SSID in order to connect to your wireless network.

Visibility Status : ☒ Visible ☐ Invisible

In order to protect your network from hackers and unauthorized users, it is highly recommended you choose one of the following wireless network security settings.

None	Security Level	Best	
<input checked="" type="radio"/> None	<input type="radio"/> WEP	<input type="radio"/> WPA-PSK	<input type="radio"/> WPA2-PSK

Security Mode:None
Select this option if you do not want to activate any security features.

Your router is now setup.

A summary page will be displayed, showing the current settings for your WAN, 2.4 GHz and 5 GHz wireless networks. It is recommended that you make a note of this information for future reference.

Click **Finish** to save your network settings.

In order for your network settings to take effect the AP will reboot automatically.

When the device has finished rebooting the main screen will display.

STEP 4: SAVE AND APPLY CHANGES

Setup complete. Click "Back" to review or modify settings.

If your Internet connection does not work, you can try the Setup Wizard again with alternative settings or use Manual Setup instead if you have your Internet connection details as provided by your ISP.

Below is a detailed summary of your settings. Please print this page out, or write the information on a piece of paper, so you can configure the correct settings on your wireless client adapters.

Time Settings :	1
NTP Server 1 :	europe.pool.ntp.org
NTP Server 2 :	192.168.2.100
Time Zone :	CET
Daylight Saving Time :	1
VPI / VCI :	8/35
Protocol :	PPPoE
Connection Type :	LLC
802.1Q VLAN ID :	0
Priority :	0
Username :	d-link
Password :	*****
SSID (2.4G):	D-Link GO-DSL-AC750
Visibility Status :	Visible
Encryption :	None
Pre-Shared Key :	N/A
WEP Key :	N/A
SSID (5G) :	D-Link GO-DSL-AC750_5G
Visibility Status (5G) :	Visible
Encryption (5G) :	None
Pre-Shared Key (5G) :	N/A
WEP Key (5G) :	N/A

Manual Configuration Setup

If you wish to change the default settings or adjust the configuration of the GO-DSL-AC750 you may use the web-based configuration utility. To access the configuration utility, open a web-browser such as Internet Explorer and enter address of the router (**http://192.168.1.1**).

Non-Windows and Non-Mac users may also connect by typing **http://192.168.1.1** in the address bar.

Select **admin** from the drop-down menu and then enter your password. The default password is **admin**.

A screenshot of the "LOGIN" page of the router's web-based configuration utility. The page has an orange header with the word "LOGIN" in white. Below the header, it says "Input username and password". There are two input fields: "Username:" with a dropdown menu showing "admin" and a small downward arrow, and "Password:" with a text box containing six black dots. Below these fields is a checkbox labeled "Remember my login info. on this computer". At the bottom right is a blue "login" button.

Internet Setup

Click **Internet Setup** on the left menu to configure your connection manually.

If you want to configure your router to connect to the Internet using the wizard, click **Wizard** on the left menu and you will be directed to the Quick Setup Wizard.

Click the **Add** button to reveal the DSL configuration options.

The following parameters will be available for configuration:

VPI: Virtual path identifier (VPI) is the virtual path between two points in an ATM network. Its valid value is between 0 and 255. Enter the correct VPI provided by your ISP. By default, VPI is set to 1.

VCI: Virtual channel identifier (VCI) is the virtual channel between two points in an ATM network. Its valid value is between 1 and 65535. Enter the correct VCI provided by your ISP. By default, VCI is set to 32.

Service Category: Select the Quality of Service types for this Virtual Circuit. The ATM QoS types include CBR (Constant Bit Rate), VBR (Variable Bit Rate) and UBR (Unspecified Bit Rate). These QoS types are all controlled by the parameters specified below, including PCR, SCR and MBS.

Peak Cell Rate: Peak cell rate (PCR) is the maximum rate at which cells can be transmitted along a connection in the ATM network.

Sustainable Cell Rate: Sustainable cell rate (SCR) is the maximum rate that traffic can pass over PVC without the risk of cell loss.

Maximum Burst Size: Maximum burst size (MBS) is the maximum number of cells that can be transmitted at the PCR.

Protocol: Select the appropriate protocol from the drop-down menu.

Encapsulation Mode: You can select LLC or VCMUX. In this example, the encapsulation mode is set to LLC.

802.1Q VLAN ID: Select this option to Activate/Deactivate the 4094 VID on the 4 different queues. VID (VLAN ID) is the identification of the VLAN, which is basically used by the standard 802.1Q. It has 12 bits and allows the identification of 4096 (2^{12}) VLANs. Of the 4096 possible VIDs, a VID of 0 is used to identify priority frames and value 4095 (FFF) is reserved, so the maximum possible VLAN configurations are 4,094

Enable Service: Choose to enable or disable the service.

Service Name: Enter a name for the service.

INTERNET SETUP

This screen allows you to configure an WAN connection.

Click **Apply** to save your Internet Setup settings.

2.4G Wireless

On this page the user can configure the Wireless settings for this device. There are 2 options to configure 2.4G Wireless Settings. Firstly, the user can choose to make use of the **Wireless Basic** settings. Secondly, the user can choose to make use **Wireless Security** settings.

Click the **Wireless Basic** button to view the basic wireless configuration options .

Enable Wireless: Choose to enable or disable the wireless networks.

AP Isolate: Choose to enable or disable wireless isolation.

SSID: Enter an SSID for the wireless network.

Visibility Status: Choose to enable SSID broadcast so other wireless devices can find the network.

Continent/Country: Depending on what country the router is used in, regulations provide for the router to automatically set the transmit power and frequencies that may be used in that country.

802.11 Mode: Select from the dropdown menu the mode of operation you require.

Bandwidth: Use the dropdown menu to select the channel bandwidth.

Wireless Channel: Use the dropdown menu to select a wireless channel, or let the router scan automatically.

2.4G Wireless Security

Wireless security helps to prevent unauthorized users from accessing your wireless network, or seeing data being passed between the router and wireless clients. The GO-DSL-AC750 supports two popular wireless security protocols, you should select a protocol based on the wireless clients which will be accessing your network.

Wired Equivalent Privacy (WEP) - This is an older form of wireless security and should only be used if your wireless clients do not support the newer WPA or WPA2 protocols.

Wi-Fi Protected Access (WPA/WPA2) - This is a newer and more secure protocol for wireless security. It uses a cipher combined with a pre-shared key (password) to encrypt data being sent over the wireless network. It is recommended that you use this security method if it is supported by your wireless clients.

Wireless Security Mode: Select a wireless security encryption option. You can also choose to not use one by selecting **None**, but this is not recommended.

The image shows a configuration window titled "WIRELESS SECURITY". Inside, there is a label "Wireless Security Mode :" followed by a dropdown menu. The dropdown menu is currently set to "None". Below the dropdown are two buttons: "Apply" and "Cancel".

The image shows the same "WIRELESS SECURITY" configuration window, but the "Wireless Security Mode :" dropdown menu is open. The menu lists four options: "None", "WPA only", "WPA2 only", and "WPA/WPA2 Mixed". The "None" option is currently highlighted. A "Cancel" button is visible to the right of the dropdown menu.

5G Wireless

On this page the user can configure the Wireless settings for this device. There are 2 options to configure 5G Wireless Settings. Firstly, the user can choose to make use of the **Wireless Basic** settings. Secondly, the user can choose to make use **Wireless Security** settings.

Click the **Wireless Basic** button to view the basic wireless configuration options .

Enable Wireless: Choose to enable or disable the wireless networks.

AP Isolate: Choose to enable or disable wireless isolation.

SSID: Enter an SSID for the wireless network.

Visibility Status: Choose to enable SSID broadcast so other wireless devices can find the network.

Continent/Country: Depending on what country the router is used in, regulations provide for the router to automatically set the transmit power and frequencies that may be used in that country.

5G Wireless Security

Wireless security helps to prevent unauthorized users from accessing your wireless network, or seeing data being passed between the router and wireless clients. The GO-DSL-AC750 supports two popular wireless security protocols, you should select a protocol based on the wireless clients which will be accessing your network.

Wi-Fi Protected Access (WPA/WPA2) - This is a newer and more secure protocol for wireless security. It uses a cipher combined with a pre-shared key (password) to encrypt data being sent over the wireless network. It is recommended that you use this security method if it is supported by your wireless clients.

Wireless Security Mode: Select a wireless security encryption option. You can also choose to not use one by selecting **None**, but this is not recommended.

The image displays two screenshots of the 'WIRELESS SECURITY' configuration page. The top screenshot shows the 'Wireless Security Mode' dropdown menu set to 'None', with 'Apply' and 'Cancel' buttons below it. The bottom screenshot shows the same page with the dropdown menu open, revealing the following options: 'None', 'WPA only', 'WPA2 only', and 'WPA/WPA2 Mixed'. The 'Cancel' button is also visible in this state.

Local Network

When configuring the router for the first time, we recommend that you click use the **Internet Connection Setup Wizard**, and follow the instructions on the screen. This wizard is designed to assist user with a quick and easy method to configure the Internet Connectivity of this router.

Anytime during the Internet Connection Setup Wizard, the user can click on the **Cancel** button to discard any changes made and return to the main page.

Router IP Address: Enter the IP address of LAN interface. It is recommended to use an address from a block reserved for private use. This address block is 192.168.1.1- 192.168.255.254.

Subnet Mask: Enter the subnet mask of LAN interface. The range of subnet mask is from 255.255.0.0 to 255.255.255.254.

Domain Name: Enter a domain to be used as a static host name.
Check "**Configure the second IP Address and Subnet Mask for LAN**" to enable a local alias IP address if required.

IP Address: Enter the alias IP address.

Subnet Mask: Enter the alias subnet mask.

LOCAL NETWORK

This section allows you to configure the local network settings of your router. Please note that this section is optional and you should not need to change any of the settings here to get your network up and running.

ROUTER SETTINGS

Use this section to configure the local network settings of your router. The Router IP Address that is configured here is the IP Address that you use to access the Web-based management interface. If you change the IP Address here, you may need to adjust your PC's network settings to access the network again.

Router IP Address : 192.168.0.101

Subnet Mask : 255.255.255.0

Domain Name : homestation.setup

☒ Configure the second IP Address and Subnet Mask for LAN

IP Address : 192.168.249.1

Subnet Mask : 255.255.255.252

DHCP SETTINGS (OPTIONAL)

Use this section to configure the DHCP Relay for your network.

☐ Enable DHCP Relay

Relay IP Address :

Use this section to configure the built-in DHCP Server to assign IP addresses to the computers on your network.

☐ Enable DHCP Server

DHCP IP Address Range : to

DHCP Lease Time : (seconds [time not allowed less than 600s])

Use the following DNS server addresses:

☒ Enable DNS Relay

Preferred DNS server : 80.58.61.250

Alternate DNS server : 80.58.61.254

Apply Cancel

Enable DHCP Relay: You can choose Disabled, Enabled or Relay. If set to DHCP Server, the router can assign IP addresses, IP default gateway and DNS Servers to the host under Windows95, Windows NT and other operation systems that support the DHCP client.

Relay IP Address: Enter the desired DHCP relay IP address.

Enable DHCP Server: Enable or disable the DHCP server function.

DHCP IP Address Range: Enter the range of IP addresses the DHCP server can issue from.

DHCP Lease Time: The lease time determines the period that the host retains the assigned IP addresses before the IP addresses change. The default is 259200 seconds.

Enable DNS Relay: If disabled the router will accept the first received DNS assignment from one of the PP-PoA, PPPoE or MER enabled PVC(s) during the initial connection setup. If enabled you can enter the IP addresses for primary and secondary DNS servers.

Preferred DNS Server: Enter an address for a preferred DNS Server.

Alternate DNS Server: Enter an address for an alternate DNS Server.

DHCP Client Class List: Client-class processing enables the DHCP server to assign the client an address from a matching scope.

DHCP Conditional Option: Specify the conditions for DHCP class handling.

DHCP Reservations List: Use this option to reserve specific IP Addresses.

Number of Dynamic DHCP clients: Dynamic DHCP clients will be listed here with supporting information.

DHCP SETTINGS (OPTIONAL)

Use this section to configure the DHCP Relay for your network.

☐ Enable DHCP Relay

Relay IP Address :

Use this section to configure the built-in DHCP Server to assign IP addresses to the computers on your network.

☐ Enable DHCP Server

DHCP IP Address Range : to

DHCP Lease Time : (seconds [time not allowed less than 600s])

Use the following DNS server addresses:

☒ Enable DNS Relay

Preferred DNS server : 80.58.61.250

Alternate DNS server : 80.58.61.254

DHCP CLIENT CLASS LIST

Local IPv6 Network

This section enables you to specify various IPv6 settings.

IPv6 Address: Use this option to specify a static IPv6 Address.

Enable RADVD: Enable or disable the Router Advertisement Daemon

Enable DHCPv6 Server: Enable or disable the DHCPv6 server function.

Lan Address Config Mode: Select either stateless (host requests) or stateful (server provisions) LAN IPv6 addressing.

Start/End Interface ID: Enter the range of IP addresses the DHCPv6 server can issue from.

DHCPv6 Lease Time: The lease time determines the period that the host retains the assigned IP addresses before the IP addresses change.

DHCPv6 Valid Time: Specify the period for which an assigned IPv6 address remains valid.

IPv6 DNS Mode: Allow the router to accept the first received IPv6 DNS assignment from a WAN connection. Alternatively, you can manually enter the IP addresses for primary and secondary IPv6 DNS servers.

WAN Interface: Specify the WAN interface to be used.

Primary DNS: Enter an address for a preferred DNS Server.

Secondary DNS: Enter an address for an alternate DNS Server.

Get Prefix Mode: Use this option to specify whether IPv6 Prefix delegation is assigned manually or via a WAN interface.

WAN Interface: Specify the WAN interface to be used. for IPv6 prefix delegation.

Site Prefix: Manually assign an IPv6 prefix delegation.

IPv6 LAN SETTINGS

Note: Stateless DHCPv6 is supported after the IPv6 address 16-bit. For example: Interface ID range from 1 to ffff, IPv6 address range from 2111:123:123:123::1 to 2111:123:123:123::ffff.

Time and Date

This section enables you to use an international time server to set the internal time and date for the router.

Automatically Synchronize: Enable or disable automatic synchronisation with an Internet Time Server.

1st NTP Time Server: Specify an address for the primary Internet Time Server.

2nd NTP Time Server: Specify an address for the secondary Internet Time Server.

Time Zone: Select the appropriate time zone for your location. This information is required to configure the time-based options for the router.

Enable Daylight Saving: Enable or disable daylight saving.

Daylight Saving Start/End: Specify the time and date when daylight saving should start/end.

TIME AND DATE

The Time Configuration option allows you to configure, update, and maintain the correct time on the internal system clock. From this section you can set the time zone that you are in and set the NTP (Network Time Protocol) Server. Daylight Saving can also be configured to automatically adjust the time when needed.

TIME SETTING

☒ **Automatically synchronize with Internet time servers**

Port Forwarding

Port forwarding is a method to direct incoming traffic to a particular server on the LAN. Up to 16 port forwarding entries are supported.

Click **Add**, **Edit**, or **Delete** to reveal the Port forward setup options.

- WAN Connection:** Specify the WAN connection to use.
- Server Name:** Enter a name for the server or service.
- Schedule:** Select a schedule for the port to be forwarded.
- Server IP Address:** Enter the internal IP address for the traffic to be forwarded to.

PORT FORWARDING

Port Forwarding allows you to direct incoming traffic from the WAN side (identified by protocol and external port)to the internal server with a private IP address on the LAN side. The internal port is required only if the external port needs to be converted to a different port number used by the server on the LAN side. A maximum of 16 entries can be configured for each WAN connection. Select the service name, and enter the server IP address and click "Apply" to forward IP packets for this service to the specified server. Note: Modifying the **Internal Port Start** or **Internal Port End** is not recommended. If the **External Port Start** or the **External Port End** changes, the **Internal Port Start** or **Internal Port End** automatically changes accordingly.

Port Trigger

Port triggering allows ports to be opened for remote access if triggered by activity by a local computer on specified ports.

Click **Add**, **Edit**, or **Delete** to reveal the Port Trigger setup options.

- Enable Port Trigger:** Check this to enable the port trigger feature.
- Service Name:** Enter a name for the server or service.
- Rule Status:** Select whether to Enable or Disable this rule.
- Trigger Port Start/End:** Enter the starting and ending port to monitor to trigger this rule.
- Trigger Protocol:** Enter the protocol to monitor for to trigger this rule.
- Open Port Start/End:** Enter the starting and ending port to open when the rule is triggered.
- Open Protocol:** Enter the protocol to allow through the opened ports.

PORT TRIGGER

Port Trigger let the device to open TCP or UDP port to access the connection from remote host when the specified port has been opened by inside connection according to the rule. Usually the port which has been opened is different from the port which will be opened by the device. A maximum of 32 entries can be configured.

Select the service name, and fill the blanks of trigger port and new opened port. Rule can be enable or disable separately.

3G WAN Configuration

This section enables you to configure a 3G Internet connection. Click the **Add** button to reveal the setup options.

- Enable 3G Service:** Check to enable or disable 3G functionality.
- Account:** Enter your 3G Account username.
- Password:** Enter your 3G Account password.
- Dial Number:** Enter the number to be dialed.
- Net Type:** Select your 3G network access type.
- APN:** Enter the Access Point Network if there is one.
- On Demand:** Check to connect to 3G network automatically or manually.
- Inactivity Timeout:** Enter a period to disconnect an inactive connection.
- Backup delay time:** The response time allowed for 3G connection before a dial-up is initiated.
- Recovery delay time:** Specify a period to re-dial.
- Initialization Delay time:** Specify a period for the 3G connection to initialize.
- Mode Switch Delay time:** Specify a period to allow for a mode switch.
- Backup Mechanism:** Select a WAN connection to use if 3G fails.
- Checking IP address:** Specify an IP Address to test the 3G connection.
- Timeout:** Specify a period of inactivity after which an established 3G session will be ended. Set to zero or choose Auto in Reconnect Mode to disable this feature.
- Period time:** Specify a period for DSL or Ethernet uplink to be disconnected.
- Fail Tolerance:** Specify the number of failures before using the backup connection.

3G WAN CONFIGURATION

Choose "Add", "Edit", or "Delete" to configure 3G WAN interfaces.

When you want to edit the 3G configuration, please ensure the 3G is in disconnection status at first.

---	--------	------	--------	------	------

Add a Rule

Add QoS Classification Rules

Classify Type: Check to enable or disable the IPv6 Filter.

Active: Select to enable or disable this rule.

Application: Select the pre-defined application type or choose **Not Matched**.

Physical Ports: Choose the LAN Interface.

Destination MAC address: Enter the destination MAC address for the rule.

If data packets include the MAC address, the data packets are placed into the group.

Destination IP address: Enter the destination IP address for the rule. If data packets include the IP address, the data packets are placed into the group.

Enter the destination subnet mask for the rule.

Destination Subnet Mask:

Destination Port Range: Enter the destination port range. (eg. UDP/TCP port range)

Source MAC address: Enter the source MAC address. If data packets include the MAC address, the data packets are placed into the group.

Source IP address: Enter the source IP address. If data packets include the IP address, the data packets are placed into the group.

Source Subnet Mask: Enter the source subnet mask.

Source Port Range: Enter the source port range. (eg. UDP/TCP port range)

Protocol: Select the pre-defined protocol type or choose **Not Matched**.

ADD QOS CLASSIFICATION RULES	
RULE	
Classify Type : <input checked="" type="radio"/> Upstream Flow Classify Active : <input checked="" type="radio"/> Enable <input type="radio"/> Disable Application : <input type="text" value="Not Match"/> Physical Ports : <input type="text" value="Local"/>	
Destination MAC Address : <input type="text"/> Destination IP Address : <input type="text"/> Destination Subnet Mask : <input type="text"/> Destination Port Range : <input type="text"/> ~ <input type="text"/>	
Source MAC Address : <input type="text"/> Source IP Address : <input type="text"/> Source Subnet Mask : <input type="text"/> Source Port Range : <input type="text"/> ~ <input type="text"/>	
Protocol : <input type="text" value="Not Match"/> Vlan ID : <input type="text"/> DSCP : <input type="text" value="Not Set"/> 802.1p : <input type="text" value="Not Match"/>	
ACTIONS	
DSCP Remark : <input type="text" value="Not Set"/> 802.1p Remark : <input type="text" value="Not Set"/> <input type="text" value="Not Set"/> Queue # : <input type="text" value="Unbound"/>	
<input type="button" value="Save"/> <input type="button" value="Back"/>	

Vlan ID: Select this option to activate or deactivate the 4094 VID on the 4 different queues. VID (VLAN ID) is the identification of the VLAN, which is used by the standard 802.1Q. It has 12 bits and allows the identification of 4096 (2^{12}) VLANs. Of the 4096 possible VIDs, a VID of 0 is used to identify priority frames and value 4095 (FFF) is reserved. The maximum possible VLAN configurations are 4,094.

DSCP: Select a matching DSCP type.

802.1p: Select a matching 802.1p VLAN priority

DSCP Remark: The DSCP range can be between 0 to 63.

802.1p Remark: Select this option to Activate/Deactivated the 802.1p. IEEE 802.1p establishes eight levels of priority (0 ~ 7). Although network managers must determine actual mappings, IEEE has made broad recommendations. Seven is the highest priority which is usually assigned to network-critical traffic such as Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) table updates. Five and six are often for delay-sensitive applications such as interactive video and voice. Data classes four through one range from controlled-load applications such as streaming multimedia and business-critical traffic - carrying SAP data, for instance - down to "loss eligible" traffic. Zero is used as a best-effort default priority, invoked automatically when no other value has been set

Queue #: Select **Low**, **Medium**, **High** or **Highest**.

Anti-Attack Settings

This section enables you to automatically configure your router to detect and protect against several known attack types.

A denial-of-service (DoS) attack is characterized by an explicit attempt by attackers to prevent legitimate users of a service from using that service.

Port scan protection is designed to block attempts to discover vulnerable ports or services that might be exploited in an attack from the WAN.

Check **Enable Anti-Attack** to reveal the Anti-Attack configuration options. Check **Enable Attack Log** to record attack attempts to the log file.

DNS

Domain name system (DNS) is an Internet service that translates domain names into IP addresses. Because domain names are alphabetic, they are easier to remember. The Internet, however, is actually based on IP addresses. Each time you use a domain name, a DNS service must translate the name into the corresponding IP address. For example, the domain name `www.example.com` might be translated to `198.105.232.4`.

The DNS system is, in fact, its own network. If one DNS server does not know how to translate a particular domain name, it asks another one, and so on, until the correct IP address is returned.

If you are using the device for DHCP service on the LAN or using DNS servers on your ISP's network, select **IPv4 static DNS** or **IPv6 static DNS** as appropriate and enter the IP addresses in the available entry fields for the preferred DNS server and the alternate DNS server.

DNS

Click "Apply" button to save the new configuration.

NETWORK TOOLS -- NET USB

Allows you to manage net usb.

Net USB

Port Mapping

This section enables you to bind the WAN interface and the LAN interface to the same group. This allows remote computers to connect to a specific computer or service within a private local-area network (LAN).

Click **Add** to reveal the Port Mapping configuration options.

- Group Name:

Enter a group name.
- Group Interfaces:

Select from the listed interfaces from the **Available Interface** then click the <- arrow button to add them to the **Grouped Interface** list. This creates the required mapping of the ports. The group name must be unique.

PORT MAPPING

Port Mapping -- A maximum 5 entries can be configured

Port Mapping supports multiple port to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the "Add" button. The "Delete" button will remove the grouping and add the ungrouped interfaces to the Default group.

PORT MAPPING SETUP

	Group Name	Interfaces
<input type="checkbox"/>	Lan1	ethernet1,ethernet2,ethernet3,ethernet4,ra0,ra1,ra2,ra3,rai0,rai1,ra...

Add

Edit

IGMP Proxy

Creating an IGMP proxy enables the system to issue IGMP host messages on behalf of hosts that the system has discovered through standard IGMP interfaces. This allows the system to act as a proxy for its hosts after being enabled.

IGMP PROXY

IGMP proxy enables the system to issue IGMP host messages on behalf of hosts that the system discovered through standard IGMP interfaces. The system acts as a proxy for its hosts when you enable it by:
1. Enabling IGMP proxy on a WAN interface (upstream), which connects to a router running IGMP.
2. Enabling IGMP on a LAN interface (downstream), which connects to its hosts.

UPnP

This page enables you to configure the UPnP feature.

UPnP (Universal Plug and Play) is a distributed, open networking standard that uses TCP/IP for simple peer-to-peer network connectivity between devices. A UPnP device can dynamically join a network, obtain an IP address, convey its capabilities and learn about other devices on the network. In turn, a device can leave a network smoothly and automatically when it is no longer in use. UPnP broadcasts are only allowed on the LAN.

UPnP is used for popular audio visual software. It allows automatic discovery of your device in the network. If you are concerned about UPnP security, you can disable it. Block ICMP ping should be enabled so that the device does not respond to malicious Internet requests.

UPNP

Universal Plug and Play (UPnP) supports peer-to-peer Plug and Play functionality for network devices.

RIP

Use this page to select the interfaces on your device that you want to use RIP for, and the version of the protocol to be used.

Dynamic Route: Select from **OFF, RIPv1, RIPv2.**
Direction: Select either **Active** or **Passive.**

RIP CONFIGURATION

To activate RIP for the device, select the "Enabled" checkbox for Global RIP Mode. To configure an individual interface, select the desired RIP version and operation, followed by placing a check in the "Enabled" checkbox for the interface. Click the "Apply" button to save the configuration, and to start or stop RIP based on the Global RIP Mode selected.

NAT

This screen lets you set up NAT for your router to link external IP address with internal IP addresses.

- Entry Name:** Enter a name for the address to be mapped.
- Internal IP Type:** Select either **Single IP** or **IP Range**.
- Internal IP Address:** Enter the IP or the IP Range
- External IP Type:** Select either **Single IP** or **IP Range**.
- External IP Address:** Enter the IP or the IP Range

NAT

Traditional NAT would allow hosts within a private network to transparently access hosts in the external network, in most cases. In a traditional NAT, sessions are uni-directional, outbound from the private network. Sessions in the opposite direction may be allowed on an exceptional basis using static address maps for pre-selected hosts.

Management

System Management

The System Management sections provides a number of options to manage the Go-DSL-AC750. This section allows you to manage the router's configuration settings, reboot the router, and restore the router to the factory default settings. Restoring the unit to the factory default settings will erase all settings, including any rules that you've created.

Reboot: Click **Reboot** to immediately restart the router.

Backup Setting: Use this option to save the current router configuration settings to a file on the hard disk of the computer you are using. First, Click **Backup Setting**. A file dialog will appear, allowing you to select a location and file name for the settings.

Update Setting: Use this option to load previously saved router configuration settings. First, use the **Browse** option to find a previously saved file of configuration settings. Then, click the **Update** button to transfer those settings to the router.

Restore Default Setting: Click **Restore Default Setting** to restore all configuration settings back to the settings that were in effect at the time the router was shipped from the factory. Any settings that have not been saved will be lost, including any rules that you have created.

SYSTEM -- REBOOT

Click the button below to reboot the router.

[Reboot](#)

SYSTEM -- BACKUP SETTINGS

Back up DSL Router configurations. You may save your router configurations to a file on your PC.

Note: Please always save configuration file first before viewing it.

[Backup Setting](#)

SYSTEM -- UPDATE SETTINGS

Update DSL Router settings. You may update your router settings using your saved files.

SYSTEM -- RESTORE DEFAULT SETTINGS

Restore DSL Router settings to the factory defaults.

[Restore Default Setting](#)

Firmware Update

You can upgrade the firmware of the access point here. Make sure the firmware you want to use is on the local hard drive of the computer. Click on **Browse** to locate the firmware file to be used for the update. Please check the D-Link support website for firmware updates at <http://support.dlink.com>. You can download firmware upgrades to your hard drive from this site.

- Current Firmware Version:** This field displays information about the current firmware.
- Current Firmware Date:** This field displays the date of the current firmware.
- Select File:** Click **Browse** to locate the firmware file required.
- Clear Config:** Check **Clear Config** to reset all current configurations before the firmware is installed.
- Update Firmware:** Click **Update Firmware** to upload and install the selected firmware.

FIRMWARE UPDATE
Step 1: Obtain an updated firmware image file from your ISP.
Step 2: Enter the path to the image file location in the box below or click the "Browse" button to locate the image file.
Step 3: Click the "Update Firmware" button once to upload the new image file.
NOTE: The update process takes about 2 minutes to complete, and your DSL Router will reboot. Please DO NOT power off your router before the update is complete.

FIRMWARE UPDATE
Current Firmware Version: V1.0.0.0

RACL

ACCESS CONTROLS -- IP ADDRESS

Permits access to local management services.

IP Address

Account Password

The Account Password section enables you to manage users' passwords.

You should change the default admin password to secure your network.

Ensure that you remember the new password or write it down and keep it in a safe and separate location for future reference. If you forget the password, you will need to reset the device to the factory default settings and all configuration settings of the device will be lost.

Username: Select the username that you want to modify.

New Username: If you are adding a new user account, enter the username in this field.

Current Password: Enter the current password (existing users only).

New Password: Enter the new password.

Confirm Password: Re-enter the new password.

Web Idle Time Out: Set a period of time to automatically log the user out if the session is inactive for the specified amount of time.

ACCOUNT PASSWORD

Access to your DSL Router is controlled through three user accounts: admin, support, and user.

The user name "support" is used to allow an ISP technician to access your DSL Router for maintenance and to run diagnostics. This user name can not be used in local.

The user name "user" can access the DSL Router, view configuration settings and statistics, as well as update the router's firmware.

Use the fields below to enter up to 16 characters and click "Apply" to change or create passwords. Note: Password cannot contain a space.

IP Address

On this page, you can configure the IP address for the access control list (ACL). If ACL is enabled, only devices with the specified IP addresses can access the device.

Check **Enable Access Control Mode** to enable the ACL, then click Add, to reveal further options for adding an IP address to the ACL.

IP Address: Enter an IP Address to be added to the ACL.

IP ADDRESS

The IP Address Access Control mode, if enabled, permits access to local management services from IP addresses contained in the Access Control List. If the Access Control mode is disabled, the system will not validate IP addresses for incoming packets. The services are the system applications listed in the Service Control List.

Enter the IP address of the management station permitted to access the local management services, and click "Apply".

Log Configuration

The GO-DSL-AC750 keeps a running log of events and activities occurring on the Router. You may send these logs to a SysLog server on your network. You can view the current log by clicking the **View System Log** button.

Enable Log: Check to enable or disable logging

Mode: Select to record the log to **Local**, **Remote**, or **Both**.

Server IP Address: Enter an IP address for the remote logging server.

Server UDP Port: Enter the UDP port of the remote server.

The screenshot shows the 'SYSTEM LOG' configuration page. At the top, there is an orange header with the text 'SYSTEM LOG'. Below this, a grey box contains explanatory text: 'If the log mode is enabled, the system will begin to log all the selected events. If the selected mode is "Remote" or "Both", events will be sent to the specified IP address and UDP port of the remote syslog server. If the selected mode is "Local" or "Both", events will be recorded in the local memory.' Below this text, it says 'Select the desired values and click "Apply" to configure the system log options.' and a note: 'Note: This will not work correctly if modem time is not properly set! Please set it in "Setup/Time and Date"'. The main configuration area is titled 'SYSTEM LOG -- CONFIGURATION' and contains a checkbox for 'Enable Log', a 'Mode' dropdown menu currently set to 'Local', and two text input fields for 'Server IP Address' and 'Server UDP Port'. At the bottom of this area are three buttons: 'Apply', 'Cancel', and 'View System Log'.

SYSTEM LOG

If the log mode is enabled, the system will begin to log all the selected events. If the selected mode is "Remote" or "Both", events will be sent to the specified IP address and UDP port of the remote syslog server. If the selected mode is "Local" or "Both", events will be recorded in the local memory.

Select the desired values and click "Apply" to configure the system log options.

Note: This will not work correctly if modem time is not properly set! Please set it in "Setup/Time and Date"

Logs

The GO-DSL-AC750 keeps a running log of events and activities occurring on the router. If the device is rebooted, the logs will automatically be cleared.

The router automatically logs (records) events of possible interest in its internal memory. If there isn't enough internal memory for all events, logs of older events are deleted but logs of the latest events are retained. The Logs option allows you to view the router logs. You can define what types of events you want to view and the level of the events to view. This router also has external Syslog Server support so you can send the log files to a computer on your network that is running a Syslog utility.

Route Info

The Route Info page displays a summary of the current route configuration between the router and the WAN.

Connecting To Your Wireless Network

Windows® 8

WPA/WPA2

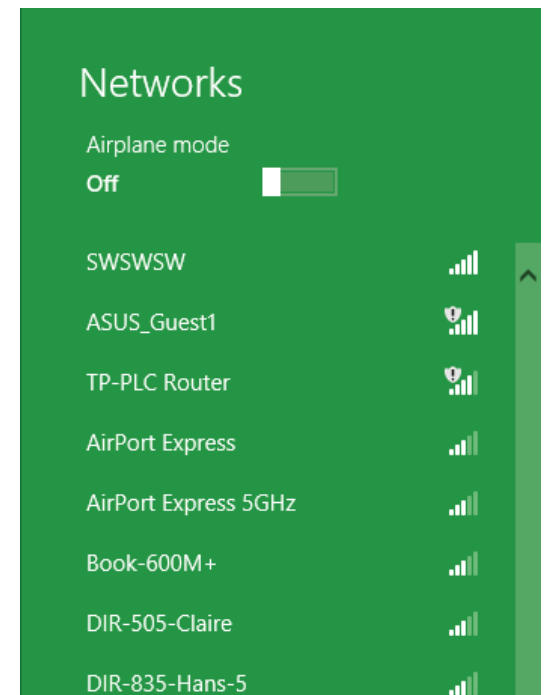

It is recommended to enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key (Wi-Fi password) being used.

To join an existing network, locate the wireless network icon in the taskbar, next to the time display.

Wireless Icon

Clicking on this icon will display a list of wireless networks which are within connecting proximity of your computer. Select the desired network by clicking on the network name.

You will then be prompted to enter the network security key (Wi-Fi password) for the wireless network. Enter the password into the box and click **Next**.

If you wish to use Wi-Fi Protected Setup (WPS) to connect to the router, you can also press the WPS button on your router at the point to enable the WPS function.

When you have established a successful connection a wireless network, the word **Connected** will appear next to the name of the network to which you are connected.

Windows® 7

WPA/WPA2

It is recommended to enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key or passphrase being used.

1. Click on the wireless icon in your system tray (lower-right corner).

Wireless Icon

2. The utility will display any available wireless networks in your area.

3. Highlight the wireless connection with Wi-Fi name (SSID) you would like to connect to and click the **Connect** button.

If you get a good signal but cannot access the Internet, check your TCP/IP settings for your wireless adapter. Refer to the Networking Basics section in this manual for more information.

4. The following window appears while your computer tries to connect to the router.

5. Enter the same security key or passphrase (Wi-Fi password) that is on your router and click **Connect**. You can also connect by pushing the WPS button on the router.

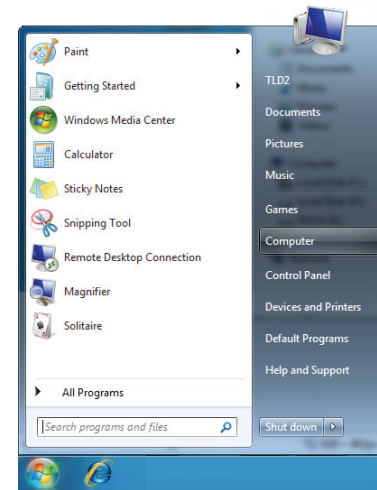

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the security settings are correct. The key or passphrase must be exactly the same as on the wireless router.

WPS

The WPS feature of the GO-DSL-AC750 can be configured using Windows® 7. Carry out the following steps to use Windows® 7 to configure the WPS feature:

1. Click the **Start** button and select **Computer** from the Start menu.

2. Click **Network** on the left side.

3. Double-click the GO-DSL-AC750.

4. Input the WPS PIN number (on the router label) in the **Setup** > **Wireless Setup** menu in the Router's Web UI) and click **Next**.

5. Type a name to identify the network.

6. To configure advanced settings, click the  icon.

Click **Next** to continue.

7. The following window appears while the Router is being configured.

Wait for the configuration to complete.

8. The following window informs you that WPS on the router has been setup successfully.

Make a note of the security key as you may need to provide this security key if adding an older wireless device to the network in the future.

9. Click **Close** to complete WPS setup.

Windows Vista®

Windows Vista® users may use the built-in wireless utility. If you are using another company's utility, please refer to the user manual of your wireless adapter for help with connecting to a wireless network. Most utilities will have a "site survey" option similar to the Windows Vista® utility as seen below.

If you receive the **Wireless Networks Detected** bubble, click on the center of the bubble to access the utility.

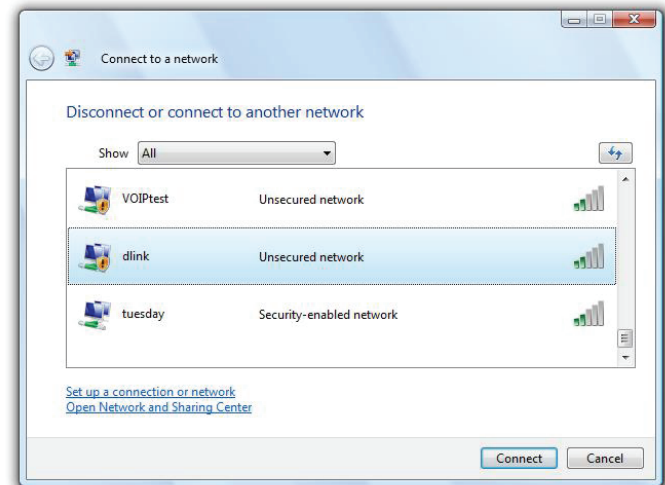

or

Right-click on the wireless computer icon in your system tray (lower-right corner next to the time). Select **Connect to a network**.

The utility will display any available wireless networks in your area. Click on a network (displayed using the SSID) and click the **Connect** button.

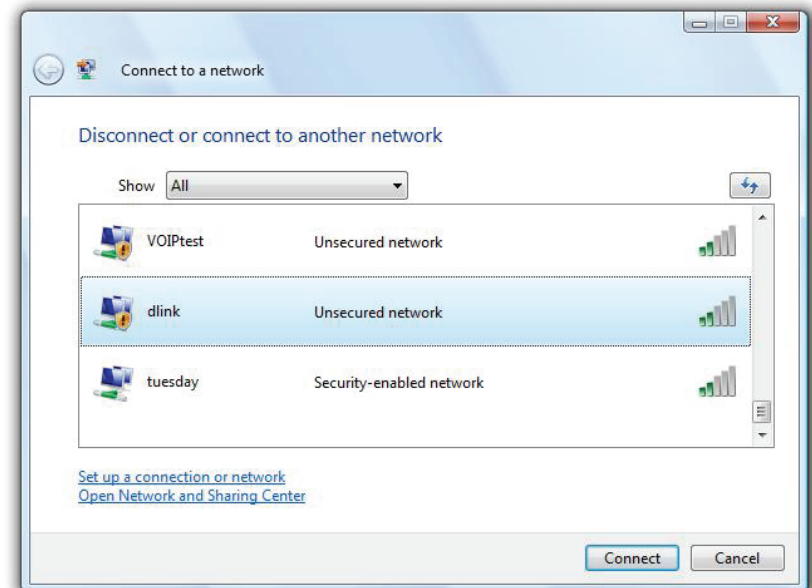

If you get a good signal but cannot access the Internet, check you TCP/IP settings for your wireless adapter. Refer to the **Networking Basics** section in this manual for more information.

WPA/WPA2

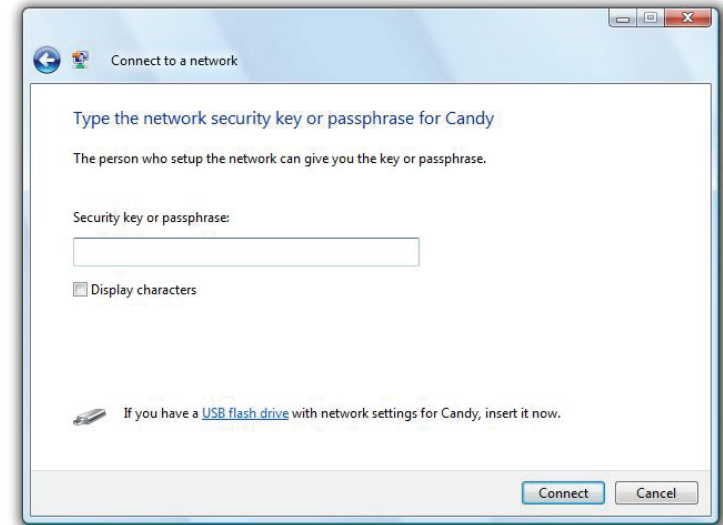

It is recommended to enable wireless security (WPA/WPA2) on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the security key or passphrase being used.

1. Open the Windows Vista® Wireless Utility by right-clicking on the wireless computer icon in your system tray (lower right corner of screen). Select **Connect to a network**.
2. Highlight the Wi-Fi name (SSID) you would like to connect to and click **Connect**.

3. Enter the same security key or passphrase (Wi-Fi password) that is on your router and click **Connect**.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the security settings are correct. The key or passphrase must be exactly the same as on the wireless router.

WPS/WCN 2.0

The router supports Wi-Fi protection, referred to as WCN 2.0 in Windows Vista®. The following instructions for setting this up depends on whether you are using Windows Vista® to configure the router or third party software.

When you first set up the router, Wi-Fi protection is disabled and unconfigured. To enjoy the benefits of Wi-Fi protection, the router must be both enabled and configured. There are three basic methods to accomplish this: use Windows Vista's built-in support for WCN 2.0, use software provided by a third party, or manually configure.

If you are running Windows Vista®, log into the router and click the **Enable** checkbox in the **Basic > Wireless** section. Use the Current PIN that is displayed on the **Advanced > Wi-Fi Protected Setup** section or choose to click the **Generate New PIN** button or **Reset PIN to Default** button.

If you are using third party software to set up Wi-Fi Protection, carefully follow the directions. When you are finished, proceed to the next section to set up the newly-configured router.

Windows® XP

Windows® XP users may use the built-in wireless utility (Zero Configuration Utility). The following instructions are for Service Pack 2 users. If you are using another company's utility, please refer to the user manual of your wireless adapter for help with connecting to a wireless network. Most utilities will have a "site survey" option similar to the Windows® XP utility as seen below.

If you receive the **Wireless Networks Detected** bubble, click on the center of the bubble to access the utility.

or

Right-click on the wireless computer icon in your system tray (lower-right corner next to the time). Select **View Available Wireless Networks**.

The utility will display any available wireless networks in your area. Click on a Wi-Fi network (displayed using the SSID) and click the **Connect** button.

If you get a good signal but cannot access the Internet, check you TCP/IP settings for your wireless adapter. Refer to the **Networking Basics** section in this manual for more information.

WPA/WPA2

It is recommended to enable WPA on your wireless router or access point before configuring your wireless adapter. If you are joining an existing network, you will need to know the WPA key being used.

1. Open the Windows® XP Wireless Utility by right-clicking on the wireless computer icon in your system tray (lower-right corner of screen). Select **View Available Wireless Networks**.
2. Highlight the Wi-Fi network (SSID) you would like to connect to and click **Connect**.

3. The **Wireless Network Connection** box will appear. Enter the WPA-PSK Wi-Fi password and click **Connect**.

It may take 20-30 seconds to connect to the wireless network. If the connection fails, please verify that the WPA-PSK settings are correct. The Wi-Fi password must be exactly the same as on the wireless router.

Troubleshooting

This chapter provides solutions to problems that can occur during the installation and operation of the GO-DSL-AC750. Read the following descriptions if you are having problems. The examples below are illustrated in Windows® XP. If you have a different operating system, the screenshots on your computer will look similar to the following examples.

1. Why can't I access the web-based configuration utility?

When entering the IP address of the D-Link router (192.168.1.1 for example), you are not connecting to a website nor do you have to be connected to the Internet. The device has the utility built-in to a ROM chip in the device itself. Your computer must be on the same IP subnet to connect to the web-based utility.

- Make sure you have an updated Java-enabled web browser. We recommend the following:
 - Microsoft Internet Explorer® 7 and higher
 - Mozilla Firefox 3.5 and higher
 - Google™ Chrome 8 and higher
 - Apple Safari 4 and higher
- Verify physical connectivity by checking for solid link lights on the device. If you do not get a solid link light, try using a different cable or connect to a different port on the device if possible. If the computer is turned off, the link light may not be on.
- Disable any Internet security software running on the computer. Software firewalls such as Zone Alarm, Black Ice, Sygate, Norton Personal Firewall, and Windows® XP firewall may block access to the configuration pages. Check the help files included with your firewall software for more information on disabling or configuring it.

- Configure your Internet settings:
 - Go to **Start > Settings > Control Panel**. Double-click the **Internet Options** icon. From the **Security** tab, click the button to restore the settings to their defaults.
 - Click the **Connection** tab and set the dial-up option to Never Dial a Connection. Click the LAN Settings button. Make sure nothing is checked. Click **OK**.
 - Go to the **Advanced** tab and click the button to restore these settings to their defaults. Click **OK** three times.
 - Close your web browser (if open) and open it.
- Access the web management. Open your web browser and enter the IP address of your D-Link router in the address bar. This should open the login page for your web management.
- If you still cannot access the configuration, unplug the power to the router for 10 seconds and plug back in. Wait about 30 seconds and try accessing the configuration. If you have multiple computers, try connecting using a different computer.

2. What can I do if I forgot my password?

If you forgot your password, you must reset your router. Unfortunately this process will change all your settings back to the factory defaults.

To reset the router, locate the reset button (hole) on the rear panel of the unit. With the router powered on, use a paperclip to hold the button down for 10 seconds. Release the button and the router will go through its reboot process. Wait about 30 seconds to access the router. The default IP address is 192.168.1.1. When logging in, the username is **admin** and leave the password box empty.

3. Why can't I connect to certain sites or send and receive emails when connecting through my router?

If you are having a problem sending or receiving email, or connecting to secure sites such as eBay, banking sites, and Hotmail, we suggest lowering the MTU in increments of ten (Ex. 1492, 1482, 1472, etc).

To find the proper MTU Size, you'll have to do a special ping of the destination you're trying to go to. A destination could be another computer, or a URL.

- Click on **Start** and then click **Run**.
- Windows® 95, 98, and Me users type in **command** (Windows® NT, 2000, XP, Vista®, and 7 users type in **cmd**) and press **Enter** (or click **OK**).
- Once the window opens, you'll need to do a special ping. Use the following syntax:

ping [url] [-f] [-l] [MTU value]

Example: **ping yahoo.com -f -l 1472**

```
C:\>ping yahoo.com -f -l 1482
Pinging yahoo.com [66.94.234.13] with 1482 bytes of data:
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Packet needs to be fragmented but DF set.
Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
C:\>ping yahoo.com -f -l 1472
Pinging yahoo.com [66.94.234.13] with 1472 bytes of data:
Reply from 66.94.234.13: bytes=1472 time=93ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=109ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=125ms TTL=52
Reply from 66.94.234.13: bytes=1472 time=203ms TTL=52
Ping statistics for 66.94.234.13:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 93ms, Maximum = 203ms, Average = 132ms
C:\>
```

You should start at 1472 and work your way down by 10 each time. Once you get a reply, go up by 2 until you get a fragmented packet. Take that value and add 28 to the value to account for the various TCP/IP headers. For example, let's say that 1452 was the proper value, the actual MTU size would be 1480, which is the optimum for the network we're working with ($1452+28=1480$).

Once you find your MTU, you can now configure your router with the proper MTU size.

To change the MTU rate on your router follow the steps below:

- Open your browser, enter the IP address of your router (192.168.1.1) and click **OK**.
- Enter your username (admin) and password (blank by default). Click **OK** to enter the web configuration page for the device.
- Click on **Setup** and then click **Manual Configure**.
- To change the MTU enter the number in the MTU field and click **Save Settings** to save your settings.
- Test your email. If changing the MTU does not resolve the problem, continue changing the MTU in increments of ten.

Wireless Security

This section will show you the different levels of security you can use to protect your data from intruders. The GO-DSL-AC750 offers the following types of security:

- WPA2 (Wi-Fi Protected Access 2)
- WPA (Wi-Fi Protected Access)
- WPA2-PSK (Pre-Shared Key)
- WPA-PSK (Pre-Shared Key)

What is WPA?

WPA (Wi-Fi Protected Access), is a Wi-Fi standard that was designed to improve the security features of WEP (Wired Equivalent Privacy).

The 2 major improvements over WEP:

- Improved data encryption through the Temporal Key Integrity Protocol (TKIP). TKIP scrambles the keys using a hashing algorithm and, by adding an integrity-checking feature, ensures that the keys haven't been tampered with. WPA2 is based on 802.11i and uses Advanced Encryption Standard (AES) instead of TKIP.
- User authentication, which is generally missing in WEP, through the extensible authentication protocol (EAP). WEP regulates access to a wireless network based on a computer's hardware-specific MAC address, which is relatively simple to be sniffed out and stolen. EAP is built on a more secure public-key encryption system to ensure that only authorized network users can access the network.

WPA-PSK/WPA2-PSK uses a passphrase or key to authenticate your wireless connection. The key is an alpha-numeric password between 8 and 63 characters long. The password can include symbols (!?*&_) and spaces. This key must be the exact same key entered on your wireless router or access point.

WPA/WPA2 incorporates user authentication through the Extensible Authentication Protocol (EAP). EAP is built on a more secure public key encryption system to ensure that only authorized network users can access the network.

Networking Basics

Check your IP address

After you install your new D-Link adapter, by default, the TCP/IP settings should be set to obtain an IP address from a DHCP server (i.e. wireless router) automatically. To verify your IP address, please follow the steps below.

Click on **Start > Run**. In the run box type **cmd** and click **OK**. (Windows® 7/Vista® users type **cmd** in the **Start Search** box.)

At the prompt, type **ipconfig** and press **Enter**.

This will display the IP address, subnet mask, and the default gateway of your adapter.

If the address is 0.0.0.0, check your adapter installation, security settings, and the settings on your router. Some firewall software programs may block a DHCP request on newly installed adapters.

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : dlink
    IP Address . . . . . : 10.5.7.114
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 10.5.7.1

C:\Documents and Settings>
```

Statically Assign an IP address

If you are not using a DHCP capable gateway/router, or you need to assign a static IP address, please follow the steps below:

Step 1

Windows® 7 - Click on **Start > Control Panel > Network and Internet > Network and Sharing Center**.

Windows Vista® - Click on **Start > Control Panel > Network and Internet > Network and Sharing Center > Manage Network Connections**.

Windows® XP - Click on **Start > Control Panel > Network Connections**.

Windows® 2000 - From the desktop, right-click **My Network Places > Properties**.

Step 2

Right-click on the **Local Area Connection** which represents your network adapter and select **Properties**.

Step 3

Highlight **Internet Protocol (TCP/IP)** and click **Properties**.

Step 4

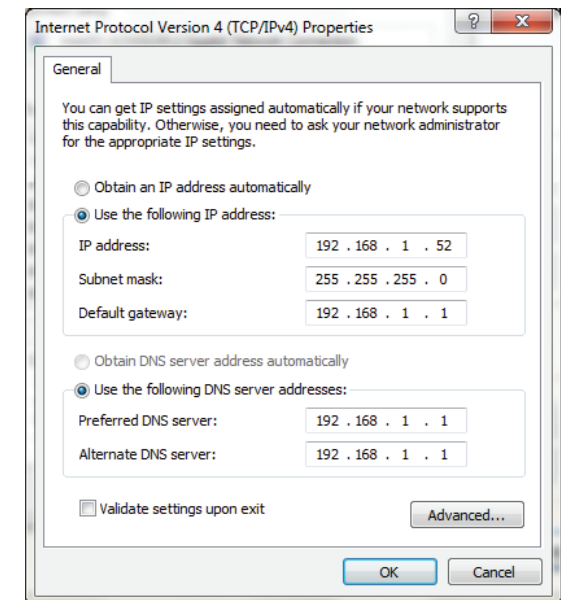

Click **Use the following IP address** and enter an IP address that is on the same subnet as your network or the LAN IP address on your router.

Example: If the router's LAN IP address is 192.168.1.1, make your IP address 192.168.1.X where X is a number between 2 and 99. Make sure that the number you choose is not in use on the network. Set the Default Gateway the same as the LAN IP address of your router (I.E. 192.168.1.1).

Set Primary DNS the same as the LAN IP address of your router (192.168.1.1). The Secondary DNS is not needed or you may enter a DNS server from your ISP.

Step 5

Click **OK** twice to save your settings.

Link'n Print

D-Link Link'n Print allows you to share USB devices such as external storage drives and multifunction printers with other users across your network by simply connecting the device to select D-Link routers. This allows you to use an external storage drive or printer located across your network as if it were connected to your local PC.

- System Requirements
- Microsoft® Windows
- 2000 / 2003 / XP / Vista / 7 / 8 (32-bit / 64-bit)
- Pentium 3 800MHz or better
- 256MB RAM or higher
- CD-ROM drive
- A compatible D-Link router

Installation

1. Insert the CD-ROM into your computer.
2. Follow the on-screen instructions.
3. The purple icon will appear in the Windows System Tray at the lower-right corner of the desktop and a new icon will be created on the desktop.

Set up the D-Link Router

1. Connect the D-Link Router to the network.
2. Power on the D-Link Router.
3. Double-click on the icon to open D-Link Link'n Print.
4. Right-click on in the System Tray at the lower-right corner on your Windows Desktop. To click on "Configuration..." and a pop up window will display the D-Link Router management GUI.
5. Log in to the router management GUI and navigate to the Net USB page.
6. Select "Enable Link'n Print" and click the "Apply" button.
7. The icon in the Windows System Tray will change to a green icon.

Connect USB Devices to the D-Link Router

The D-Link Link'n Print automatically detects for each connected USB device. A window will pop up for each detected USB device.

1. Right-click on the Windows System Tray icon.
2. Click on Open D-Link Link'n Print.
3. The D-Link Link'n Print displays the connected USB devices on the network. To click "Connect" to have the USB device connected.
4. Advanced Options can be set by clicking on Advanced Options.

Virtually Connect or Disconnect a USB Device

1. Move the cursor to Waiting to Connect and click on Connect to virtually connect a USB device.
2. The D-Link Link'n Print displays which user is virtually connecting this USB device.
3. Move the cursor to In Use By (Owner) and click on Disconnect to virtually disconnect the USB device.

When the USB Device is a Multifunction Printer

1. Move the cursor to Waiting to Connect and click on Manage Device.
2. Click Yes on the question “Do you want to install the printer software or MFP utility?”
3. Insert the CD-ROM of the multifunction printer and follow the instructions to install the multifunction printer’s driver. When the installation process prompts you to connect the multifunction printer to your PC, click Next.

4. The D-Link Link'n Print virtually connects to this multifunction printer. Click Next

USB SETUP

With Link'n print feature, the USB device on the router will be connected to your PC over IP. This router can also be configured as a USB device server that you can enable this function and plug-in your USB device to share it with other people over your LAN network.

☒ Enable Link'n Print
☐ Enable USB Storage Server

Apply

5. Choose the printer driver that you want D-Link Link'n Print to auto-connect when you print.

USB SETUP

With Link'n print feature, the USB device on the router will be connected to your PC over IP. This router can also be configured as a USB device server that you can enable this function and plug-in your USB device to share it with other people over your LAN network.

☒ Enable Link'n Print
☐ Enable USB Storage Server

Apply

When You Want to Scan

1. Move the cursor to Available for Use and click on Scan Now.
